

# Metal-clad GSM Dialler

## Operates on the mobile network

A remarkably versatile little unit. This dialler needs no landline or even mains power, and can communicate with up to five mobile or landline phones by text message and / or voice call and immediately report a problem, be it security, process control or power-failure.

Enhanced security features include password protection on all commands and incoming call filtering.

It also boasts a remotely controlled output that can be used to arm and disarm an alarm system, trigger a siren, activate a CCTV recording, switch on lighting, release a locked gate etc. simply by sending it a text message.

The dialler is ideal for temporary or permanent installation in remote properties with or without mains power, as it operates on a 12 volt supply. Connected to a car battery, it will run happily for typically 2 months between charges.

The built-in 433MHz receiver allows it to be armed and disarmed by remote control handset (two supplied with dialler), and to interface with wireless door contacts, PIR sensors, smoke detectors etc.

When used with our **FarmGuard** perimeter protection system it will contact key-holders and a security patrol the instant the perimeter is breached, providing an extremely effective and economical security solution.

Price - **£175** + VAT (includes a SIM card on a network of your choice)
